## Overview

Attribute Definitions produce a single [IdPAttribute](#) object, which may then be passed along to a relying party by attaching one or more [AttributeEncoders](#) to it. The ability to attach encoders is what distinguishes them from an [IdPAttribute](#) produced by [data connectors](#). Attribute definitions may, but need not, be based on the output of a data connector, and often transform their input.

Note that multiple encoders can be attached to a single [IdPAttribute](#) object.

## Schema Name and Location

All elements and plugins described in this page and its children are defined by the `urn:mace:shibboleth:2.0:resolver` namespace, the schema for which is located at <http://shibboleth.net/schema/idp/shibboleth-attribute-resolver.xsd>

Prior to V3.3 supplied plugins were defined by a schema type (`xsi:type`) in the `urn:mace:shibboleth:2.0:resolver:ad` namespace, the schema for which is located at <http://shibboleth.net/schema/idp/shibboleth-attribute-resolver-ad.xsd>. This is still supported, but every element or type in the `urn:mace:shibboleth:2.0:resolver:ad` namespace has an equivalently-named version in the `urn:mace:shibboleth:2.0:resolver` namespace.

## Common Attributes

Name	Type	Default	Description
<b>id</b>	String		Identifier for the <a href="#">IdPAttribute</a> as well as its definition. This is used for logging and to establish dependencies and relationships between connectors and definitions.
<b>activationConditionRef</b>	Bean Reference		Bean ID of a condition to decide whether to resolve this definition, see <a href="#">here</a> . Mutually exclusive with <code>relyingParties</code>
<b>relyingParties 3.4</b>	space-delimited list		List of entity IDs for which this Attribute Definition should be resolved. Mutually exclusive with <code>activationConditionRef</code>
<b>dependencyOnly</b>	boolean	false	If set to true, the attribute is not exposed outside the resolution process and is available solely within the resolution process

<b>sourceAttributeID</b>	String	<p><i>DEPRECATED in V3.4</i></p> <p><b>NOTE:</b> This attribute <i>only</i> applies when dependencies are supplied via the deprecated &lt;Dependency&gt; Element, and is ignored otherwise.</p> <p>This defines the name of an <a href="#">IdAttribute</a> used as input to the attribute definition, and can only be applied to some definition types.</p> <p>The source attribute may be the output of another attribute definition or the output of a <a href="#">DataConnector</a>. If any data connectors are used as dependencies, the source attribute <b>MUST</b> be identified or an error will result.</p>
<b>profileContextStrategyRef</b>	Bean Reference	Bean ID of a function injected to override the normal lookup process for the request's <a href="#">ProfileRequestContext</a>

## Common Child Elements

All Attribute Definitions can have zero or more of each the following three child elements.

Prior to V3.3 the child elements had to be specified in a strict order, with the Common Child Elements coming first. This has been relaxed in V3.3.

Name	Cardinality	Description
<Dependency>	0 or more	<p><i>DEPRECATED in V3.4</i></p> <p>This element has a single attribute (ref="whatever") whose content is the ID of an attribute definition or data connector whose output is an input to this attribute definition</p>
<InputAttributeDefinition> <sup>3.4</sup>	0 or more	This element identifies an attribute definition which is an input to this attribute definition.
<InputDataConnector> <sup>3.4</sup>	0 or more	This element identifies a data connector whose attributes are to be input to this attribute definition.
<DisplayName>	0 or more	<p>A human readable name for this attribute. This name may, for example, be displayed to the user to consent to the attribute's release.</p> <p>If multiple display names are used, then they should bear an <code>xml:lang</code> attribute to distinguish them.</p>
<DisplayDescription>	0 or more	<p>A human readable description of for this attribute. This name may, for example, be displayed to the user to consent to the attribute's release.</p> <p>If multiple display descriptions are used, then they should bear an <code>xml:lang</code> attribute to distinguish them.</p>
<AttributeEncoder>	0 or more	A definition of how an attribute will be encoded for inclusion in a message to a relying party. These are distinguished by an <code>xsi:type</code> attribute, and the different types are documented <a href="#">here</a> .

Other allowable child elements are specific to the `xsi:type` of the AttributeDefintion used, and these are documented for each type.

## AttributeDefinition Plugin Types

Attribute Definitions are distinguished by their schema type, which is inside the `xsi:type` XML attribute. The following types are supported:

<code>xsi:type</code>	Function
<a href="#">Simple</a>	Copies an input attribute to an output attribute. Typically this is used to 'expose' attributes which are sourced from a <a href="#">DataConnector</a> .
<a href="#">PrincipalName</a>	Exposes the subject's canonicalized principal name as an attribute definition.
<a href="#">Scoped</a>	Applies a (fixed) scope to the input attribute's values
<a href="#">Prescoped</a>	Splits input attribute values into values and scopes
<a href="#">RegexSplit</a>	Splits input attribute values according to a regular expression
<a href="#">ScriptedAttribute</a>	Generates an attributes using a <a href="#">JSR-223</a> script
<a href="#">Mapped</a>	Allows many to many mapping of input values to output values according to regular expression mapping rules

<a href="#">Template</a>	Feeds the input values (potentially from multiple input attributes) into a Velocity template to construct output values
<a href="#">SubjectDerived</a> 3.3	Extracts data from the authenticated Subject(s)
<a href="#">ContextDerived</a> 3.3	Extract arbitrary data from the request context via a Function bean
<b>PrincipalAuthenticationMethod</b>	<b>DEPRECATED</b> , exposes the authentication flow used to authenticate the subject for front-channel requests
<b>TransientId</b>	<b>DEPRECATED</b> , see the <a href="#">V2 Documentation</a> for details
<b>CryptoTransientId</b>	<b>DEPRECATED</b> , see the <a href="#">V2 Documentation</a> for details
<b>SAML1NameIdentifier</b>	<b>DEPRECATED</b> , see the <a href="#">V2 Documentation</a> for details
<b>SAML2NameID</b>	<b>DEPRECATED</b> , see the <a href="#">V2 Documentation</a> for details
