

HtAccessControl

This AccessControl plugin is supplied and installed by mod_shib, the SP Apache module. As long as the `<RequestMapProvider>` type is `edu.internet2.middleware.shibboleth.sp.provider.NativeRequestMapProvider`, this plugin is automatically enabled for all requests on Apache.

It supports an access control syntax derived from Apache `.htaccess` file syntax, which relies primarily on the [Require](#) command. Rules are created by specifying the Alias of an attribute established by the SP's AttributeAcceptancePolicy and the possible values (or regular expressions if the alias is followed by the `~` symbol) to match.

The `ShibRequireAll` command means that all rules must successfully apply, unlike Apache's usual practice of granting access if any requirement is met.
