

Duo 2FA Login Handler

This page briefly describes the Duo Two-Factor Authentication Login Handler for Shibboleth IdP 2.3 (or later). Click the links below for more information.

The Duo Two-Factor Authentication Login Handler adds [Duo Security](#) two-factor authentication to an existing JAAS user authentication for Shibboleth identity providers. It is based on the Shibboleth [IdP UsernamePassword authentication handler](#) and [Duo Web](#).

Instructions for [building, installing, and configuring the handler](#) are documented on the Duo web site. The [source code for the handler](#) is published in GitHub. The [Duo Web Java client](#) is also open source. After reading the documentation, if you still have questions, contact options are shown on the [Duo product](#) page.

Advanced configuration, specifically for using Duo by request rather than by default, is available here: [Duo 2FA On Demand](#).

For InCommon Participants

InCommon and Duo Security jointly offer a reduced-rate site license to higher ed institutions. Visit the InCommon web site for more information about the [Duo site license](#) option.
