Home

Shibboleth allows users to securely send trusted information about themselves to remote resources. This information may then be used for authentication, authorization, content personalization, and enabling single sign-on across a broad range of services from many different providers.

The Identity Provider(IdP) and Service Provider V2 products are now **unsupported** (as is the Centralized Discovery Service product).

The V3 Identity Provider and Service Provider software have their own documentation spaces here and here.

All software, including archived releases, is available from https://shibboleth.net/downloads/ and each release is accompanied by a detached PGP signature using one of the keys listed in the project's KEYS file. High-level information to get started with SAML and Shibboleth can be found in the Concepts wiki space.

All our software is licensed under the Apache 2.0 open source software license.

> ⊘ All deployers should make sure to subscribe to to the `announce` mailing list to be sure of seeing important security announcements.
