

SPConfigurationByTopic

Most of the configuration for Shibboleth behavior for the Service Provider lies in the file `shibboleth.xml`, located by default at `/opt/shibboleth-sp/etc/shibboleth/shibboleth.xml`. Additional configuration information, particularly for protecting resources and triggering Shibboleth protection, is located in Apache's [httpd.conf](#) or [.htaccess files](#), iPlanet's [conf files](#), and IIS' [configuration](#). Log levels are defined in an extensive set of `.logger` files.

Other documentation is available, including extensive in-line comments in configuration files, [initial configuration and deployment information](#), and [a guide to moving the provider to production use](#).
