

ChainingFilter

This configuration feature is DEPRECATED and should not be used. It will be removed from V4.0 and prevent a seamless upgrade to that version.

A filter of type `ChainingFilter` allows multiple child filters to be used in sequence.

This filter type is purely for legacy compatibility and should not be used any longer. A `<MetadataProvider>` element containing multiple `<MetadataFilter>` child elements will automatically wrap them in a chain without reference to this type.

Schema

The `<MetadataFilter>` element and the type `ChainingFilter` are defined by the `urn:mace:shibboleth:2.0:metadata` schema, which can be found at <http://shibboleth.net/schema/idp/shibboleth-metadata.xsd>

Attributes

No attributes may be specified

Child Elements

Any number of `<MetadataFilter>` child elements may be specified. They will be processed in the order in which they are encountered.
