

Home

Below is the documentation available for V3 of the Shibboleth Service Provider, including all 3.x patch and minor upgrade releases. Documentation is split up in to two parts: documentation meant for individuals that are deploying and managing a Service Provider and documentation related to building /developing it.

The [current stable release](#) of the Service Provider is V3.0.4, and there is no supported [previous stable release](#).

All software, including archived releases, is available from <https://shibboleth.net/downloads/service-provider/> and each source and Windows release is accompanied by a detached PGP signature using one of the keys listed in the project's [PGP_KEYS](#) file.

All our software is licensed under the [Apache 2.0](#) open source software license.

All deployers need to subscribe to the [Shibboleth Announcement mailing list](#). This is where announcements about new releases, end of life of past releases, and [security advisories](#) are distributed.

High-level information to get started with SAML and Shibboleth can be found in the [Concepts](#) wiki space.
